Weekly paper 5

The first main idea that I retained from chapter one of the python book was that python is very useful for a lot of different applications, from small web scripts to mission critical programs, and for data analytical purposes. The second main idea that I got from this chapter was that python is very useful for bridging the gap between many different old legacy languages so it is useful for already developed systems. The third main idea that I got from the chapter was that python, while being versatile and useful, is also very slow. Other programming languages compile and run much more efficiently than python, and the most complex programs, including those with process spawning and multi-thread purposes, should not be down in python.
